**SPECIAL QUOTATIONS.** Prices, particularly of Field Seeds, depend upon market conditions and are subject to change without notice. We will quote large quantities at prices as low as the highest quality of seed will permit. Let us quote you current prices on Grass and Field Seeds, Seed Potatoes and Onion Sets.

**SEED TREATMENT.** The treatment of seeds before planting is good insurance against loss and poor stands due to unfavorable weather and soil conditions. The so called failure of seeds to germinate is more often due to outside influences than any fault in the seeds themselves. The most effective materials we have found for seed treatment for good general use are Spergon and Phygon. These are particularly effective on Beans, Beet, Corn, Spinach and Squash and beneficial to a lesser degree on many other seeds. It is important that the right amount of the right material be used or germination may be retarded.

We recommend that our customers use these materials only with the most recent instructions of manufacturers and Experiment Station authorities. Upon request we can furnish seed on bulk orders treated as required at a slight advance in price, but we do not guarantee or hold ourselves responsible for results.

**MAIL ORDERS.** In the shipping season we endeavor to give prompt service on orders, and give special attention to seeds needed for immediate planting. During the rush season some delay is inevitable as we are called upon to supply an ever increasing number of orders in spite of being hampered by uncertain and slow delivery of our seed supplies. Early orders are advisable, particularly for seed to be sown in greenhouses and cold frames for growing early plants. Very early orders for general garden planting may have to be held for economical handling until crops of seed are received and packaged.

**CONNECTICUT SALES AND USE TAX.** Residents of Connecticut are liable for and we must collect a tax of 2% upon a few items, such as Plant Labels, Twines, Paper Pots and feed for pets, such as Dog Feed and Bird Feeds.

**BEFORE MAILING YOUR ORDER.** Write your name, address and shipping point in full and plainly on the order sheet. Be sure to give nearest freight or express station if different from your post office address.

We will gladly send copies of this catalogue to any of your friends who may be interested.

Velvety lawns for modern buildings grow from our carefully planned mixtures

## LAWN GRASS MIXTURES

Fine lawns can be grown only from clean, high germinating seed. Our Mixtures are carefully planned for permanent velvety lawns with average soil and care. Each mixture is adapted to a particular type of use or soil condition, and composed of highly re-cleaned seed, containing a negligible amount of weed seeds and waste. The percentage of basic permanent grasses is so high that for each 400 sq. ft. only one pound of seed is needed. Conn. seal mixtures are approved by the Connecticut Department of Farms and Markets for composition, purity and germination and are your guarantee of quality. Separate varieties of grasses are listed on page 43. We will be glad to advise you as to special mixtures for unusual conditions. You may order 8 to 24 lbs. at the 15 lb. rate, prepaid; 25 lbs. or more at the 100 lb. rate, not prepaid.

## BEET

Beets may be sown as early as the ground can be worked and may be planted in succession until the first week in July. They grow well in all but the most acid soil and provide not only tender and delicious young beets, but tasty greens when the young plants are cooked entire. Sow in 14 inch drills ½ to 1 inch deep and thin to 3 inches. Use the thinned out plants for greens. Treatment with Phygon materially aids germination and produces a healthy growth.

Early Wonder

Treat Beet seed with PHYGON—it prevents damping off and insures a good stand of healthy seedlings.

**EARLY WONDER** The darkest, smoothest and most uniform bunch beet for market. Deep roots, somewhat flattened and with small tap root.

Pkt. 10c; oz. 20c; ¼ lb. 45c; lb. \$1.35;

## SWEET CORN Standard Varieties

Sweet Corn is tender and will not stand frost, nor will it germinate well in wet cold soils. It responds to good soil and clean, frequent shallow cultivation. Plant in well fertilized hills 3 feet apart each way, putting 5 or 6 kernels in each hill and covering to a depth of not more than 1½ inches. When 6 inches high remove all but the 3 most vigorous stalks from each hill. For a succession throughout the season plant several varieties early in May, including first early to late varieties. A good main crop variety planted at intervals of two weeks until the middle of July will produce a continuous supply. Treatment with Spergon is very effective in insuring the germination, especially for early plantings, and controls seed borne diseases. For prices of Spergon see page 44.

**GOLDEN MIDGET** An exceptional quality corn for even the smallest gardens. The ears are small, 8 rowed, and bear tender kernels of fine sweet flavor. In season it produces with the very earliest varieties while the stalks do not exceed 3½ feet in height.

# PEAS

Peas should be sown as early as possible in order to mature before the hot summer weather. To secure an extra early crop the smooth seeded varieties may be sown just as soon as the ground can be worked. The wrinkled varieties are not quite as hardy and should be planted a little later. Sow 2 or 3 inches deep in single or double rows 3 to 4 feet apart. The tall growing sorts require brush or other support. This is not so necessary for the dwarf varieties but they are greatly benefited if kept off the ground. Inoculation of the seed before planting with Nodogen increases the crop and enriches the soil.

# SPINACH

The most important greens crop. It is very hardy and will stand considerable freezing weather, but many varieties run to seed rapidly in hot weather. It is of easy culture and by successional sowing a supply may be secured throughout the season. For early spring use sow late in September and protect with hay or straw through the winter. May be sown in spring as early as the ground can be worked, either in rows or broadcast. Summer sowings should be on freshly plowed ground and the soil must be packed hard about the seed, as it will not germinate in dry soil.

Spinach seed treated with PHYGON germinates more evenly with a better stand.

# TOMATO

To furnish desirable early plants the seed should be sown in February or March in a hotbed or box kept in a warm place. When the plants are about 2 inches high they should be thinned or transplanted to ensure stocky plants. As soon as danger from frost is past transplant to the open ground, setting about 3 feet apart each way. They should be frequently cultivated and well-fertilized. The fruit will ripen earlier and be improved in quality if the vines are pruned to two stems and trained to stakes or trellises. Plants for late summer crop may be started from seed in May.

## ANNUALS

### *Flowers That Bloom the First Year From Seed*

The best of success with many annuals may be had by sowing them in beds where they are to flower. The hardier varieties such as Calendula, Larkspur, Centaurea and Poppy may be sown very early, while the more tender, as Balsam, Nasturtium, Marigold and Zinnia, are best planted later when the ground has become warm. Prepare the soil carefully, making it soft and fine, and sow the seed broadcast or in rows. When large enough, thin the seedlings so that they stand about half as far apart as their maximum height. If a hotbed or coldframe is available many kinds may be started earlier and transplanted, hastening the blooming period. Perennials listed on page 38.

Perennials bloom for several years, ordinarily attaining satisfactory flowering size the second year. Most perennials are best sown in June so that the seedlings will be ready for transplanting after the heat of the summer is over.

A bed or coldframe where some protection from the sun can be given is best. Some kinds flower the first season and will be found listed as annuals.

# FIELD AND ENSILAGE CORNS

U. S. No. 13

CORNELL 29-3

## Ensilage Varieties

Later, leafier varieties producing heavy tonnage of ensilage per acre. Many will yield heavy crops of ears if planted early and spaced thinly for each stalk to develop. The hybrid varieties have strong root systems and usually outyield the open-pollinated kinds.

**IDAHYBRID 544**, 105 days. Yellow dent with uniformly large ears and strong leafy stalks. For late grain or ensilage.

**SWEEPSTAKES, WESTBRANCH (Red)**, 110 days. Earliest true ensilage corn which produces mature ears in this climate.

**YELLOW SWEEPSTAKES**, 110 days. Immense leafy stalks usually ready for cutting a few days later than Westbranch. Ears are large and long with very broad yellow kernels.

## Grain Varieties

**YELLOW CANADA**, 100 days. Sometimes called 90-day yellow. The common 8-rowed flint corn of New England. Our strain produces particularly fine crops with large uniform ears.

**CORNELL 29.3 HYBRID**, 100 days. Vigorous heavy-leaved strain with a high yield of yellow dent ears tinged with red. Matures with Yellow Canada, but is leafier.

**IMPROVED SMOKY DENT**, 105 days. Reddish dent kernels with a white cap. Good producing hardy variety.

An application of 4 lbs. per 100 sq. ft., well raked in, is generally sufficient, although leafy crops will benefit by an additional application later in the season. When used in hills or drills the fertilizer should be well mixed with the soil so that seed does not come into direct contact with the fertilizer.

**LAWN FERTILIZER 4-8-4** A complete fertilizer for lawns containing material that acts quickly to produce a thick green turf that helps to keep out weeds and crab grass. An application of 4 lbs. per 100 sq. ft. in early spring is effective on most lawns. Because of its long-lasting qualities, bone meal is very desirable for fertilizing all hard wooded plants, including roses, flowering shrubs, fruit bushes, and trees. A liberal application mixed into the soil when planting bulbs or perennial plants will result in remarkable size and brilliancy of flowers. Use 25 to 50 lbs. per 1000 sq. ft.
